MySQL.

MySQL is a relational database management system. MySQL works on Microsoft Windows, macOS, Linux and many other system platforms.

MySQL comes in two different editions, the MySQL Community Edition is free to use as well as open-source. The MySQL Enterprise Edition is a subscription based service produced by Oracle Corporation, this edition is targeted more towards the commercial market. Support for the community edition can be found from the official documentation, support for the enterprise edition can be obtained via Oracle's official support

Installing MySQL on Linux Based Systems.

The steps to install Linux using a package manager would depend on the package manager used. This guide would follow the steps using both APT and YUM.

Installing MySQL using APT.

One way to install MySQL on your Linux machine using APT is using the official package, for this you would first need to add the MySQL APT repository. You can select and download the DEB file from <http://dev.mysql.com/downloads/repo/apt/>.

Once the package is downloaded, you would need to install the package, which can be done so by the following steps on the Linux terminal:

```
sudo dpkg -i /PATH/version-specific-package-name.deb
```

During the installation you would be asked to choose the desired MySQL server version and other components. The default options would be selected for you. Alternatively, if you wish to not install any additional components, you can do so by selecting 'none' as your option.

Finally, you would need to update the package lists in your system for to recognize MySQL as a new package. You can do so using the following command:

```
sudo apt-get update
```

Alternatively, you can also automatically install the MySQL server using the following command:

```
sudo apt-get install mysql-server
```

Additionally, assuming you now have the MySQL APT repository installed, you can also manually install other products and components that are available from the MySQL APT repository. You can install any the packages using the following commands:

```
sudo apt-get update
```

```
sudo apt-get install package-name
```

You can view the status of the MySQL server by running the following command:

```
sudo service mysql status
```

If you wish to stop the MySQL server, you can run the following command:

```
sudo service mysql stop
```

The following command would start the MySQL server:

```
sudo service mysql start
```

Installing MySQL using YUM.

To install MySQL on a Linux based system using the YUM, you would first need to add the MySQL Yum repository into the system's repository list (if it is not already added).

To add the MySQL Yum Repository, you would first need to download it from <http://dev.mysql.com/downloads/repo/yum/> . Once downloaded, you can use the following command to install the downloaded package.

```
sudo yum localinstall platform-and-version-specific-package-name.rpm
```

If you would like to check if the Yum repository had been installed successfully, you can run the following command:

```
yum repolist enabled | grep "mysql.*-community.*"
```

By default, there would already be a release series selected and you can proceed with the installation. If you wish to do so, please refer to the steps available on the documentation from the MySQL website.

Finally, you would need to install MySQL, the following command can be used to install MySQL:

```
sudo yum install mysql-community-server
```

In order to start the MySQL server, you can run the following command:

```
sudo service mysqld start
```

To view the status of the MySQL server, you can run the following command:

```
sudo service mysqld status
```

Installing MySQL on macOS

This guide will demonstrate how to install MySQL on macOS using Native packages. Additionally, this guide would also cover how to install the MySQL Preference Pane

Installing MySQL using Native Packages

To install MySQL using Native Packages on macOS, you would first need to download the disk image file which can be found on <http://dev.mysql.com/downloads/mysql/>.

Once the file is downloaded, you would need to mount the disk image to see its contents, you can mount the image by double clicking on the downloaded file.

Next, you would need to install the package, the package would be a pkg file named based on downloaded version. You can double click the file to open the installer.

Once the installer is opened, the introduction screen would appear, click on “Continue” to begin the installation.

Following the Introduction screen, you would see a copy of the relevant GNU General Public License. Once reading though the License agreement, to continue, you would need to click on ‘Continue’ followed by ‘Agree’. You cannot go forward with the installation without agreeing to the license.

To install MySQL with the default options, you can directly select ‘Install’ from the Installation Type page that would appear. However, if you wish to alter certain components before installation, you can do so by selecting ‘Customize’, you would have to click on ‘Install’ after finalizing the components to install from the Customize menu.

After a successful installation, you would have to choose the default encryption type for password that would be used in MySQL. Following this, you would also need to set up default root password.

Finally, you can choose to enable or disable MySQL on startup. Clicking on 'Finish' would complete the installation process.

Installing and using the MySQL Preference Pane

The MySQL Preference pane enables you to start, stop and control automated startup during boot of your MySQL installation. The Preference Pane would be included in the MySQL installation package.

Preference pane should already be listed under your system's System Preference window. As the Preference Pane is installed with the same disk image file that installs the MySQL server. However, if you had not installed the preference pane while installing the MySQL you can do so using the same installer and selecting 'Preference Pane' from the customize menu in the installer.

Once installed, you can use the preference pane to control your MySQL server instance. You can start, stop, recreate the data directory or uninstall the MySQL server from the Instances page. The configuration page would show MySQL options such as the data directory and the path to the configuration file.

The preference pane also shows the current setting for whether the MySQL server has been set to start automatically.

Installing MySQL on Microsoft Windows

In the following section, you are going to see and learn how to download and install MySQL on your windows 10 operating system. Please read and follow the following instructions. Let's get started:

First of all, try to download MySQL installer from <https://dev.mysql.com/downloads/mysql/> and execute it. Particularly, try to download the installer community version. Down in the same page you may find a link like the one shown below, then by clicking and following the rest of the instructions, you can able to download the MySQL installer community version.

Recommended Download:

MySQL Installer

for Windows

**All MySQL Products. For All Windows Platforms.
In One Package.**

Starting with MySQL 5.6 the MySQL Installer package replaces the standalone MSI packages

Windows (x86, 32 & 64-bit), MySQL Installer MSI

[Go to Download Page >](#)

Other Downloads:

Figure 1 Choosing MySQL For Windows

Generally Available (GA) Releases

MySQL Installer 8.0.11

Select Operating System:
Microsoft Windows

[Looking for previous GA versions?](#)

Windows (x86, 32-bit), MSI Installer <small>(mysql-installer-web-community-8.0.11.0.msi)</small>	8.0.11	15.8M	Download
Windows (x86, 32-bit), MSI Installer <small>(mysql-installer-community-8.0.11.0.msi)</small>	8.0.11	230.0M	Download

We suggest that you use the [MD5 checksums](#) and [GnuPG signatures](#) to verify the integrity of the packages you download.

Figure 2 Downloading MySQL For Windows

After executing the setup file, you may end up having the window shown in Figure03. Then by following the instructions, you can able to finish to the instalment of MYSQL on your windows.

Next, in the following section after license agreement, you will have different options of setup types, as seen in Figure04. In this part, you can choose either Developer Default or Full, because in these two you can get all the required MYSQL setups for this course.

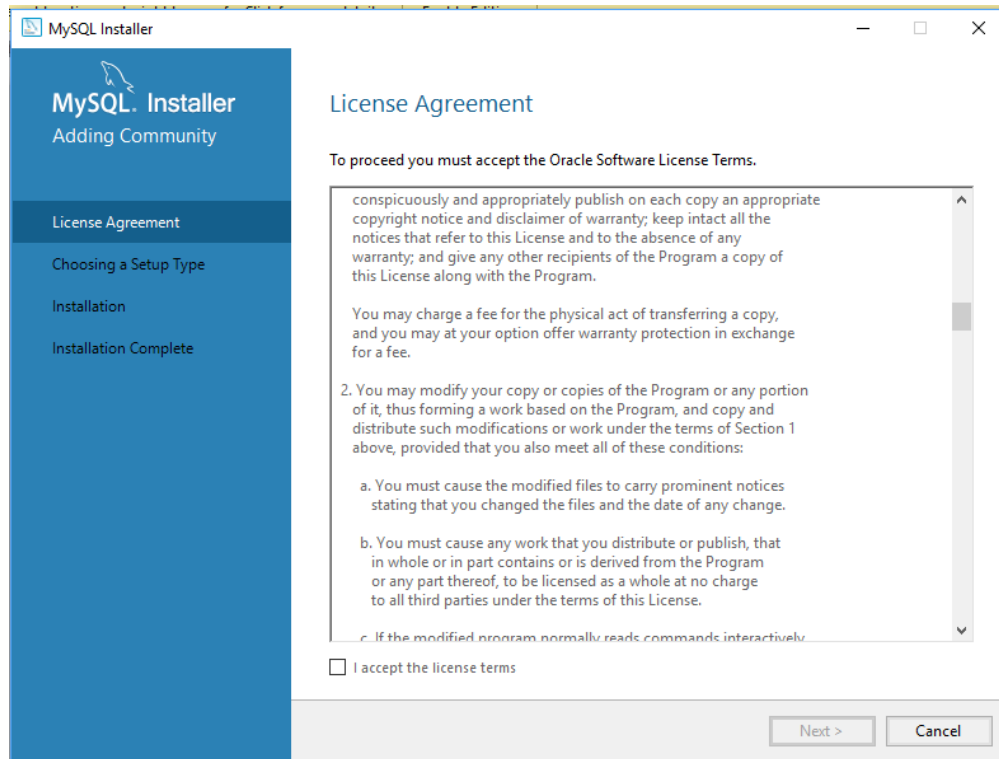

Figure 3 Terms of Service

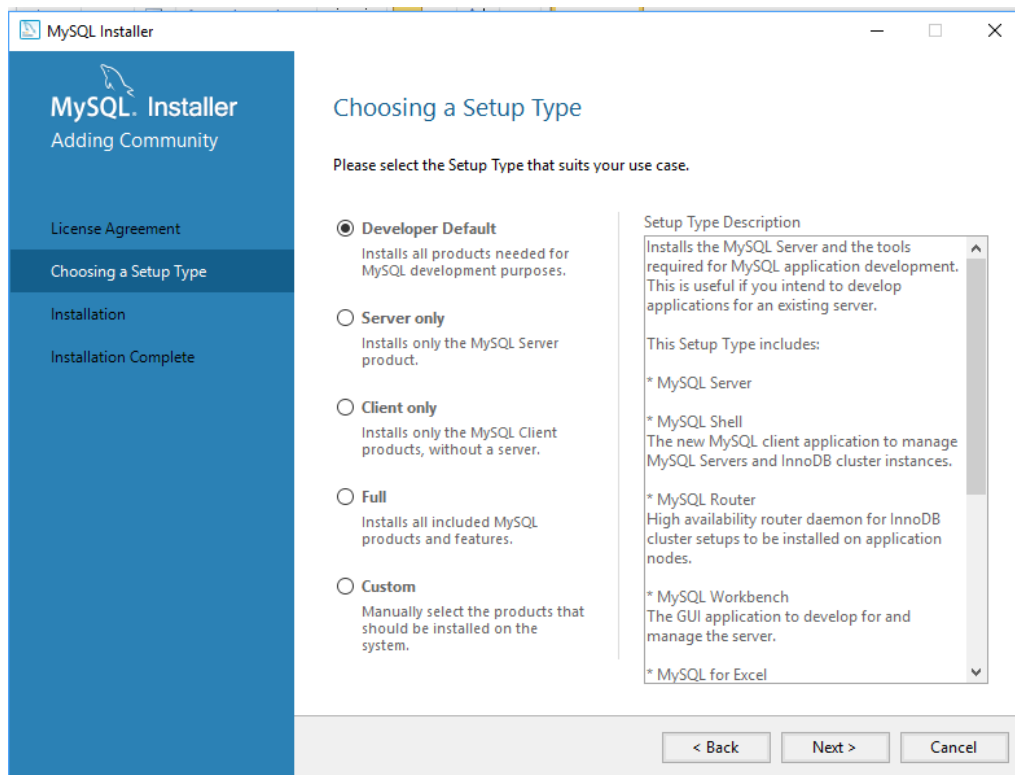

Figure 4 Choosing a Setup Type

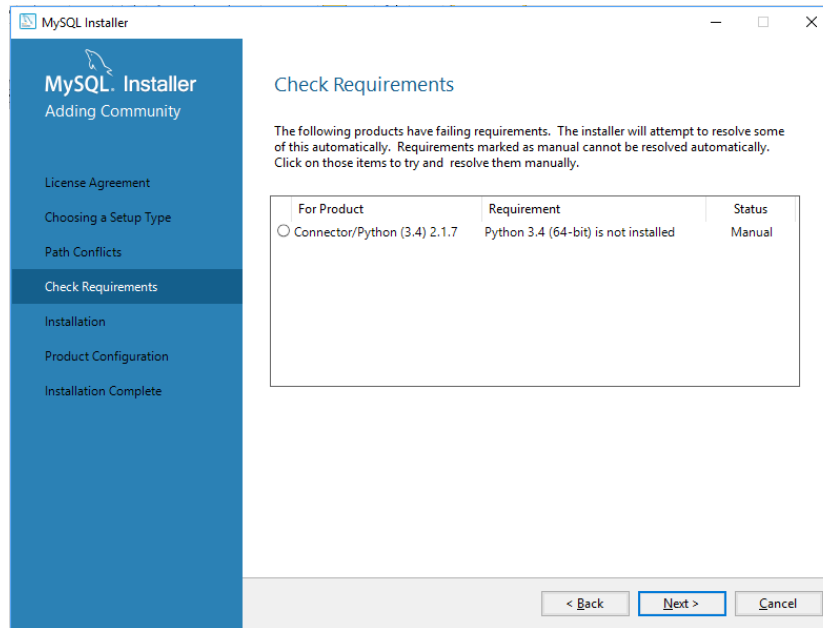

Figure 5 Checking Requirements

In the Check Requirements section, you may have some required products missing and in this case you have to install it manually to your laptop. As shown in the figure below, Connector/Python is missing but it is not necessary for me to download it, therefore I will leave it like that.

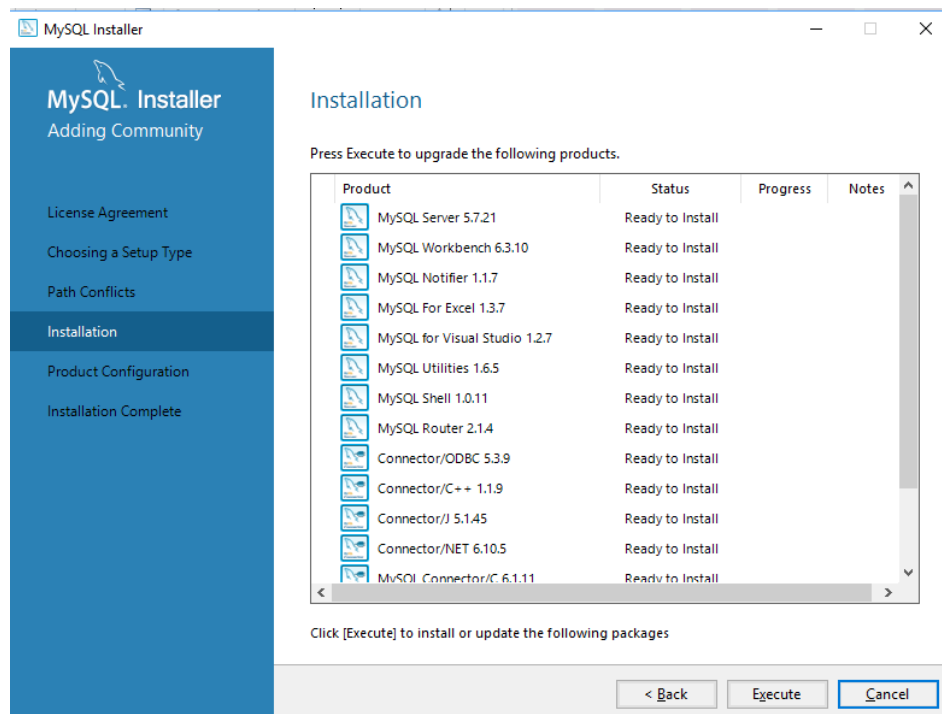

Figure 6 Installation

Next, as seen in Figure06 check if all the products are ready and then if yes click execute. If not you have to resolve the ones shown not ready.

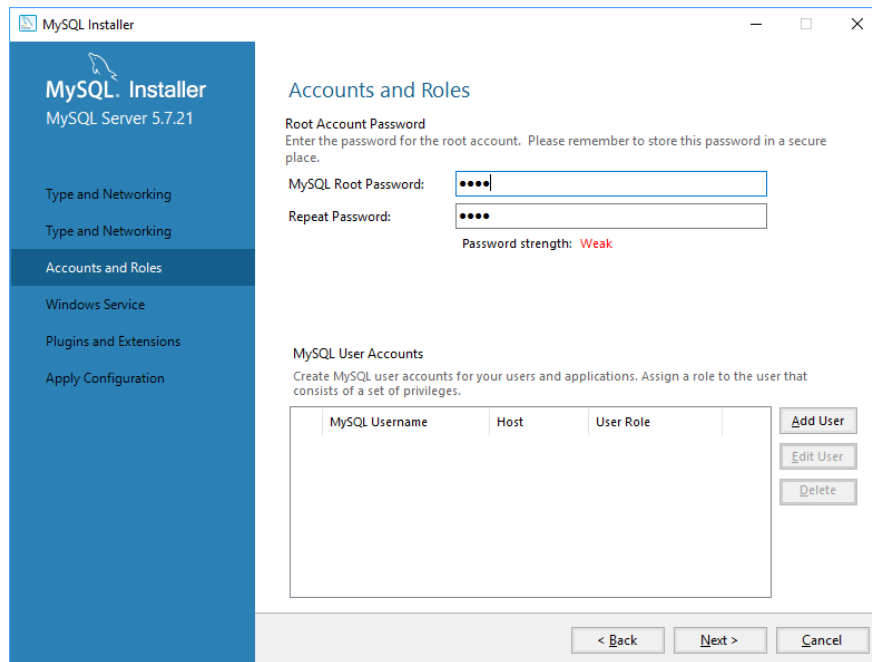

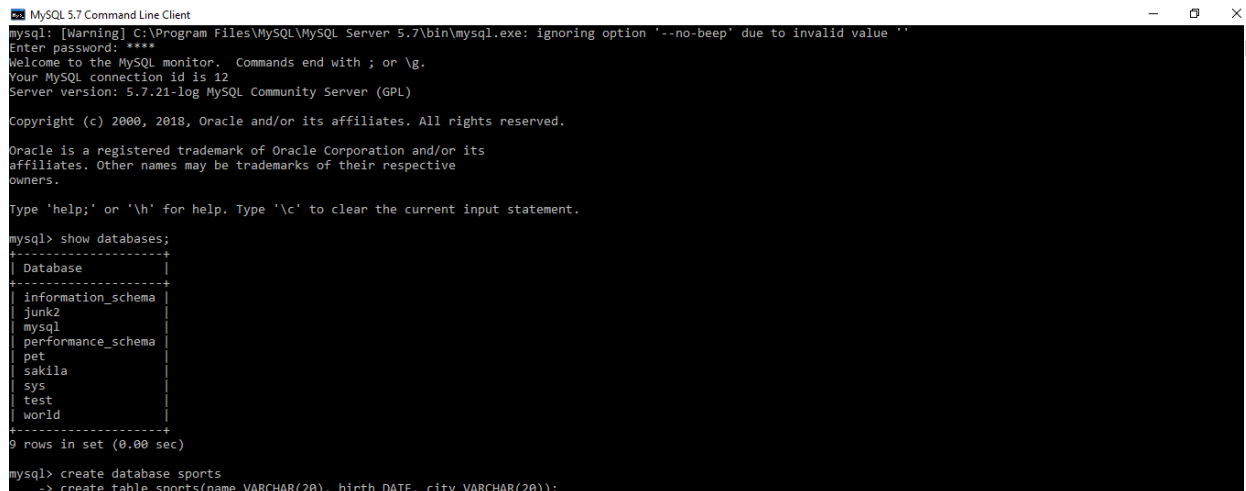

Figure 7Accounts and Roles

After completing the first part of the installation, in the second part especially in the third step, you might need to create a password (Root Account Password). For this password you might use in order to access your MYSQL.

After executing, you successfully installed MYSQL on your windows. You would need to start your MySQL, open MySQL command line and it may require entering the password you have created before.

```
mysql: [Warning] C:\Program Files\MySQL\MySQL Server 5.7\bin\mysql.exe: ignoring option '--no-beep' due to invalid value ''
Enter password: ****
Welcome to the MySQL monitor.  Commands end with ; or \g.

mysql> create database sports
-> create table sports(name VARCHAR(20), birth DATE, city VARCHAR(20));
```

Figure 8 Running MySQL on Windows

Beginner's Guide

To view a list of all the options that can be used with the `mysql` command, you can run the following:

```
mysql --help
```

Connecting to a MySQL Server

In order to connect to a MySQL server, you would need to provide a username. Additionally, if the related user also has a password set, you would need to provide the password as well. To connect to a MySQL server at localhost you can run the following command via terminal:

```
mysql -u user -p
```

If you are connecting to a MySQL server that is not on your machine, you would also need to provide the hostname or address of the machine, you can run the following command via terminal to do so.

```
mysql -h host -u user -p
```

If your server is set up such that it allows anonymous users to connect to the server, you do not need to provide a username. However, if the server is not your local machine, you would still need to provide a hostname or address.

If you would like to exit MySQL, you can do so simply by typing in “QUIT” or “\q”.

```
mysql> QUIT
```

(Notice that this is not within the bash terminal, and inside the MySQL application).

Entering Queries

Once connected to the MySQL server, you can start entering SQL queries. It is important to note that connecting to the MySQL server does not mean that a database is selected.

SQL statements are typically followed by a colon. A good example statement is:

```
mysql> SELECT VERSION(), CURRENT_DATE;
```

This query would request the version number and the current date from the server. When a query is entered, MySQL sends the query to the respective server in order to execute the given query. The result (if any) would be returned back to the screen. When the application is ready for another input from the user, 'mysql>' would appear on the screen.

Keywords in the statements are case insensitive, which means that using "Select", "SELECT", "sELECT" or any other permutation of the word would mean the same thing.

Creating and Using a Database.

Once connected to the Server, you are also able to create and use databases. Firstly, if you want to know what databases already exist in the server, you can check the list of databases using the following command from within the server:

```
mysql> SHOW DATABASES;
```

Using the command "Show Databases" would show you a list of databases that you have access to. Which means that there may be other databases that exist in the server that you cannot see due to you not having privileges (unless you are root).

If you would like to access a database that exists, you can do so by running the following command:

```
mysql> USE dbName
```

The 'USE' statement is considered a special statement and requires it to be written on its own line. Additionally, it also does not require a semi colon at the end of the statement.

If you are the administrator of the database, and wish to alter privileges that a specific user has on a specific database, you can do so by running the following command:

```
mysql> GRANT ALL ON dbName.* TO 'userName'@'hostAddress';
```

If you are the administrator of the server, or if the administrator has granted you the right privilege, you can also create your own database. This can be done by using the following command:

```
mysql> CREATE DATABASE menagerie;
```

Creating a Table

Once connected to the Server and a database is chosen, you can use tables. To view a list of all the tables, you can run the following command:

```
mysql> SHOW TABLES;
```

If you wish to create your own table, you can do so by running the following command:

```
mysql> CREATE TABLE tableName (var1 dataType, var2 dataType,  
-> var3 dataType);
```

(datatype can be any data type, for example “varchar(20)”)

After creating a table, if you would like to verify that a the table was created, you can use the ‘Describe’ statement.

```
mysql> DESCRIBE tableName;
```

Loading Data into A Table

Data can be loaded into a table in different ways. There is the ‘Insert’ statement in which you would have to enter the data yourself, and then there’ the ‘Load Data’ statement, in which you are able to load data from a file.

An Example use of the ‘Insert’ Function is as follows:

```
mysql> INSERT INTO tableName  
-> VALUES ('value1', 'value2', 'value3');
```

An Example use of the ‘Load Data’ function is as follows:

```
mysql> LOAD DATA LOCAL INFILE '/path/file.txt' INTO TABLE tableName;
```

Retrieving Information from a Table

In order to retrieve information from a table, you can use the ‘Select’ statement. This statement can be used with additional clauses such as the ‘Where’ clause to get more specific results.

An example ‘Select’ query:

```
SELECT * from tableName;
```

An example ‘Select’ query with additional ‘Where’ clause:

```
SELECT * from address WHERE variable1=value1;
```

You can also use retrieve information from more than one table at a time. Adding meaningful additional clauses such as ‘JOIN’ or ‘INNER JOIN’ would allow you to display a joined view of both tables.

Supposed you have two tables, table A and table B. Table A and B share a column, column X. You can view a joined view of both tables by entering the following query:

```
SELECT * FROM A INNER JOIN B ON A.X = B.X;
```

Running this query would return a view which would show us values from both tables.

Example

This following section would demonstrate how you can use MySQL. The Examples would cover a few parts from the “Beginner’s Guide” section. This example would show you how to Create a database, select the database you created, create a table, view entries in a table and describe the table, and finally, how to update an entry in a table.

In order to start MySQL, you need to type the full path name on Windows. If you’re using Linux or Mac, you can simply type in “mysql” via the terminal.

To create a database and select it, you can follow the commands from the previous section, or look into the commands used in Figure 9.

Once you have selected the database you created, you can proceed to type in other SQL commands, such as the SQL command that is used to create a table. Figure 10 shows an example on creating a table.

```
Command Prompt - "c:\Program Files\MySQL\MySQL Server 8.0\bin\mysql.exe" -u root -p

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql> CREATE DATABASE db_one;
Query OK, 1 row affected (0.14 sec)

mysql> USE db_one
Database changed
mysql> CREATE TABLE pet(
    -> name VARCHAR(20),
    -> owner VARCHAR(20),
    -> species VARCHAR(20),
    -> sex CHAR(1),
    -> birth DATE,
    -> death DATE
    -> );
Query OK, 0 rows affected (1.29 sec)

mysql>
```

Figure 10 Create Table

Having a table created does not mean that there would be values entered into the table by default. Figure 11 shows that the created table has no rows entered. Additionally, the ‘Describe’ feature is also shown where you can see details of a selected table.

```
Command Prompt - "c:\Program Files\MySQL\MySQL Server 8.0\bin\mysql.exe" -u root -p

mysql> USE db_one
Database changed
mysql> CREATE TABLE pet(
  -> name VARCHAR(20),
  -> owner VARCHAR(20),
  -> species VARCHAR(20),
  -> sex CHAR(1),
  -> birth DATE,
  -> death DATE
  -> );
Query OK, 0 rows affected (1.29 sec)

mysql> SELECT * FROM pet;
Empty set (0.05 sec)

mysql> DESCRIBE pet;
+-----+-----+-----+-----+-----+-----+
| Field | Type   | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| name  | varchar(20) | YES |     | NULL    |       |
| owner | varchar(20) | YES |     | NULL    |       |
| species | varchar(20) | YES |     | NULL    |       |
| sex   | char(1)    | YES |     | NULL    |       |
| birth | date       | YES |     | NULL    |       |
| death | date       | YES |     | NULL    |       |
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.16 sec)

mysql>
```

Figure 11 Select and Describe

You can insert entries into a selected table by following the steps showed in Figure 12. By default, all columns are nullable unless specified otherwise, this means that if no entry has been specified for a column when entering a new row, by default the column will be filled with a 'NULL' value.

```
Command Prompt - "c:\Program Files\MySQL\MySQL Server 8.0\bin\mysql.exe" -u root -p

mysql> INSERT INTO pet (name, owner, species, sex)
  -> VALUES(
  -> "Peter",
  -> "James Corden",
  -> "Rabbit",
  -> "M"
  -> );
Query OK, 1 row affected (0.18 sec)

mysql> SELECT * FROM pet;
+-----+-----+-----+-----+-----+-----+
| name | owner      | species | sex | birth | death |
+-----+-----+-----+-----+-----+-----+
| Peter | James Corden | Rabbit | M   | NULL  | NULL  |
+-----+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql> UPDATE pet
  -> SET birth='2017-09-21'
  -> WHERE name="Peter" AND species="Rabbit";
Query OK, 1 row affected (0.19 sec)
Rows matched: 1 Changed: 1 Warnings: 0

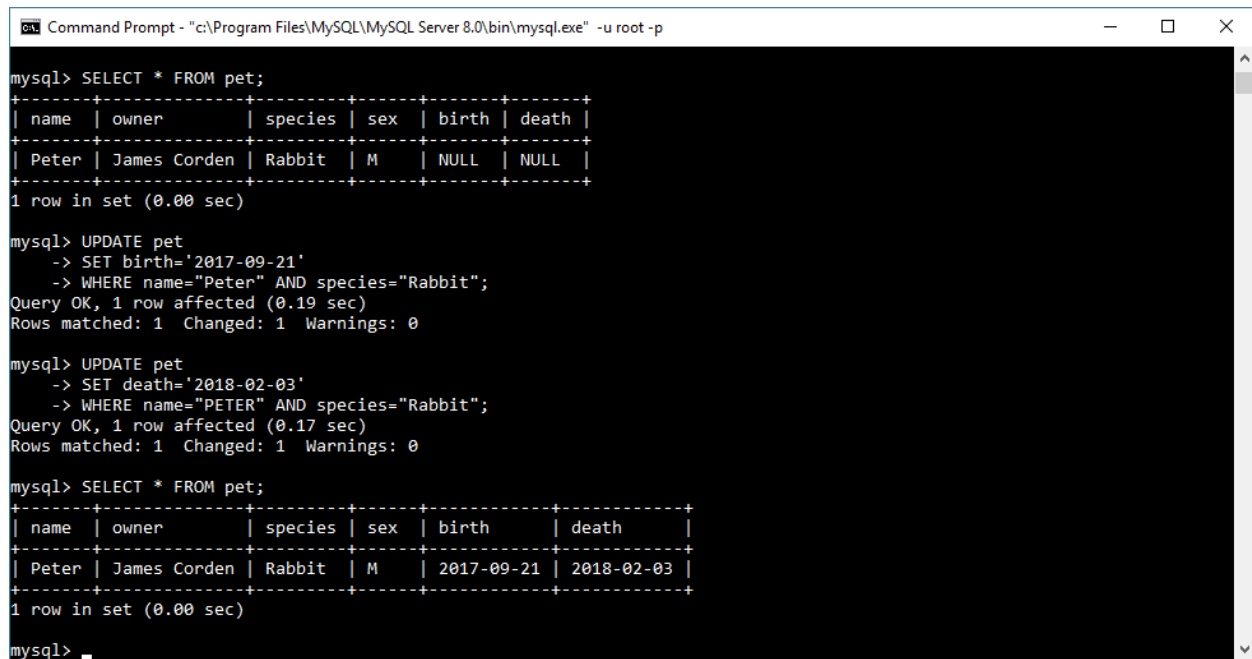

mysql> UPDATE pet
  -> SET death='2018-02-03'
  -> WHERE name="PETER" AND species="Rabbit";
Query OK, 1 row affected (0.17 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql>
```

Figure 12 Insert query and update Query

As seen from the 'SELECT' query in Figure 12, two columns remain to be NULL values. SQL allows us to change any value of a column using its 'UPDATE' feature. Figure 12 demonstrates how you can use the update feature. It is important to specify which row you want to update.

Finally, running the 'SELECT' query once again will show you the updated table with all the new values.

```
Command Prompt - "c:\Program Files\MySQL\MySQL Server 8.0\bin\mysql.exe" -u root -p

mysql> SELECT * FROM pet;
+-----+-----+-----+-----+-----+-----+
| name | owner      | species | sex | birth | death |
+-----+-----+-----+-----+-----+-----+
| Peter | James Corden | Rabbit  | M   | NULL  | NULL  |
+-----+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql> UPDATE pet
  -> SET birth='2017-09-21'
  -> WHERE name="Peter" AND species="Rabbit";
Query OK, 1 row affected (0.19 sec)
Rows matched: 1  Changed: 1  Warnings: 0

mysql> UPDATE pet
  -> SET death='2018-02-03'
  -> WHERE name="PETER" AND species="Rabbit";
Query OK, 1 row affected (0.17 sec)
Rows matched: 1  Changed: 1  Warnings: 0

mysql> SELECT * FROM pet;
+-----+-----+-----+-----+-----+-----+
| name | owner      | species | sex | birth      | death      |
+-----+-----+-----+-----+-----+-----+
| Peter | James Corden | Rabbit  | M   | 2017-09-21 | 2018-02-03 |
+-----+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql>
```

Figure 13 Table after update Queries
